

# Bakery Factory 2007

## **NIFL Resin Flooring at the Bakers**

**NIFL Resin Flooring was asked to provide an all round flooring solution for an extension to the factory of a well known chain of bakeries.**

The extension was running on a tight schedule which meant there was no time for a full cure of the concrete sub floor. NIFL had to use digital hygrometer equipment to ensure that the Relative Humidity of the concrete sub floor was ready to accept a Resin topping (below 75%). The results came out above 75% so for maximum caution, a surface DPM (Damp Proof Membrane) was installed prior to the installation of the AltroCast TB.

The Resin screed was selected aesthetically to match the current Resin flooring in the existing factory in texture and colour. It was also selected to stand up to the vigorous environment of a busy food processing unit, including possessing slip resistance qualities when dry. New techniques had to be employed by NIFL for this project including the use of a low level halogen light and a Power Trowel specially designed for Quartz systems.

The Bakery Chain is now getting ready to install further resin systems to the other areas of their extension.
