Another Successful Installation

NIFL Resin Flooring has successfully installed another Hygienic, High-Performance Solution to a Food Processing Environment.

NIFL Resin Flooring mechanically prepared the original floor ready for the application of Pumaprime SF. Once applied and cured, 6mm nominal thickness of Pumadur HF (FeRFA Type 8 Classification) was installed to the area along with 100mm high coving using Pumadur WR on to a Pumaprime TC Primer.

The Polyurethane Resin system has been developed over three decades of research and in-use assessment to provide a hard-wearing and impervious surface that is ideally suited for the market.

Furthermore, independent research from the Campden and Chorleywood Food Research Association (CCFRA) underlines the suitability of this product for the Food Environment.

Specifying the system was the result of careful analysis of all the necessary parameters such as proposed environments, desired longevity, traffic levels and hygiene regulations.
